

Decision Control Structures

Decision Control Structures

- ▶ Control instructions changes the sequence of execution of program.
- ▶ **Statement** : Any instruction ended with semicolon.
- ▶ **Expression**: which gives certain o/p
- ▶ **Condition**: expression which evaluates to either true or false or a variable with true or false value;
- ▶ **Decision making and branching**
 - if
 - if else
 - switch case

if & if else

► Syntax of if

```
if(condition)
```

```
{
```

```
    Statements;
```

```
}
```

- A semicolon after if or else terminates the statement so its error
- No need of braces for single statement.

Syntax of if else

```
if(condition)
```

```
{
```

```
    Statements;
```

```
}
```

```
else
```

```
{
```

```
    Statements;
```

```
}
```

else if ladder(Nested if else)

4

Syntax

```
if(condition1)
{
    Statements;
}
else if(condition 2)
{
    Statements;
}
else if(condition 3)
{
    Statements;
}
```

- Here care should be taken for exactly matching parenthesis of if and else.
- Any mistake in parentheses created misplaced else problem

switch- case

5

- ▶ Alternative to else if ladder
- ▶ Used to select one of several paths
- ▶ Syntax

```
switch( integral expression)
{
    case constant1:
        Statements;
        break;
    case constant1:
        Statements;
        break;
    default:
        Statements;
}
```

switch- case

6

- ▶ Integral expression must yield integer value.
- ▶ It could be int const or expr which result to int const.
- ▶ We can use int or char expression. Like 2+3 or 'a'+'b'
- ▶ case label must be int const or char const or const expr.
- ▶ default is executed when no match found.
- ▶ default is optional.
- ▶ If match found all cases below this case gets executed. Use break to stop this.
- ▶ For multiple statements use { }

switch- case

7

- ▶ **continue** can not be used in switch.
- ▶ Generally used for menu selection.
- ▶ No two cases can have same label.
- ▶ Only one **default** is allowed.
- ▶ Can execute common set of statements.

- ▶ Ex. case 'a':

- case 'A':

- Statements;

- break;

- ▶ **switch** can only test equality.
- ▶ **float** is not allowed in switch or as case label.

switch- case

- ▶ `char` constants are converted to `int` when used in `case`.
- ▶ We can use expression with variables in switch but not as case label.
 - ▶ Ex. `switch(i*j+k) => valid`
 - ▶ `case (3+7) => valid`
 - ▶ `case (a+b) => Invalid`
 - ▶ `case (i<20) => Invalid`
 - ▶ The last two are the limitations of switch
 - ▶ Discuss Flochart

exit()

9

- ▶ `exit()` is library function.
- ▶ It terminates program execution.
- ▶ `exit(0);` => graceful exit.
- ▶ `exit(1);` => erroneous exit.

Unconditional Statements

10

▶ goto:

- ▶ It transfers control from one statement to other statement.
- ▶ Use of goto is not good programming practice.
- ▶ Syntax: goto identifier.
- ▶ Identifier is label given to statement where control is to be transferred.
- ▶ Syntax of Identifier :
 - ▶ Identifier: program statement;
- ▶ EX. To print no in reverse

```
int no= 321;  
loop: printf("%d",no%10);  
no=no/10;  
if(no !=0)  
goto loop;
```

Thank You
